Make drop down list in google sheets

Hi, thanks for your post! But if you use the FILTER feature, it's a very quick and simple method to get the result of a dependent drop list. See you again How about the whole column? I can't do in the whole column. What's the solution? when I choose the name I want to automatically department and designate change.how to do it. I would totally like feedback on this as well please. What I did to solve some problems in the comments: 1) For each line to get verification data in different columns, but in the same line (I used indirect, but you can use vlookup, etc.)) 2) Get Google sheets to check the list of values in line 3) Strange, Google sheets do not allow the use of formulas, so when I copy the cell format in the lines below, it gets stuck with the first line of value. So I just made this formula on Excel and uploaded to Google Drive and opened with Google sheets. Then copied this sheet to a sheet that I had used earlier. Then I just copied the cells into the cells that I wanted to format the check. Thank you very much! I've seen a version with scripts, but this option doesn't show up in my Google sheets. It worked for me!! An awesome explanation is there a way to make a drop on each row? that will depend on the value next to it. For example, Column A will hold the first drop (fruits or vegetables) and drop B will depend on column A. Hi I'm having problems. I have a list of projects that have individual project managers. I can make the project manager work to see their projects, but I need to choose a project and the right project manager show Wayne Thank you for the article! I created a very simple dependants drop down the list for my excel using the above method. These two columns are the title and subtitle, with the subtitle of the drop-down options depending on the value in the title. I tested it in both the Excel and WPS tables and it works fine. However, when I upload to Google documents, instead of showing me the correct dropdown list in subheading, it shows download ... Any idea why this is happening and how to fix it? After reading the comments, I'm not sure if I have a similar problem. I want to create a list of addicted falls and then do a data check for everyone. If I use your example, you have data in D3 like vegetables/fruits and then addicted drop down to E3 based on selection in D3. Then I would have in the D4 - D10 all the cells with data check allows me to choose fruits or vegetables and then have in the cells E4 - E10, dependent down lists based on the selection in D4-D10. Is there a way to do this? Thank you you ever understand this, I have a similar problem with just the first cell dropout list one running with a dropout list of two. I thought I could just copy and paste down a sheet, but didn't know how to do it. I hope I make sense. In Excel, you have the ability to format Fall. This allows a range of input and cellular communication, so you can enter enter and then tie that cage to the formula. Anything like that in Google sheets? This is great! I have a question though that I couldn't find in your article. I have a situation where I want to create a drop drop and their dependents drop down for many lines. For example, in each line you enter the date, category, and then it's the relevant elements. The indirect formula refers only to one cell. For your example D3. But when the new data is included in the D4, I want the new dependant list to refer to the category chosen in D5, not D4. How will it work if I need it to function again and again line by line? Do I need to make a ton of indirect formulas in the new sheet and manually do individual checks for each dependent list to refer to my unique indirect formula, which indicates the list of categories of this dependent? Do I make sense? Thank you!! Hey Jenna, Hey Jenna ... Unfortunately, in Google Sheets, you can't have the data checks show a drop down the list when it comes to the formula (only for a number of cells). The best solution, in this case, is to create as many lists as there are drop drops. For example, if you have 5 drops falling, then you should have five sets of lists, each of which refers to the corresponding drop down. I wish there was a better solution. There is a way to do this with scripts, but I haven't delved into it yet. Will try to update this tutorial if the script method works. Comments are closed. A list of Google dropouts can be useful if you want the user to choose from pre-defined options. It's a great way to make data entry consistent. Watch the video - Making Drop Down lists in Google sheets For example, a user from a fall list can easily choose a country like the US. But if you give him the opportunity to enter it manually, he can enter the U.S. or the United States of America. You see the benefit here. By giving it a ready-made option in the form of a fall down, you've made data entry simple as well as consistent. In this tutorial you'll learn: How to create a fall down list in Google sheets. How to copy the fall down lists. How to remove drop lists from cells. There are two ways to create a fall down list in Google sheets: Use a number of cells to create a fall down. Manually entering the items of the fall list down. Using a range of cells to create a drop Down list in Google sheets Suppose you have a list of countries in A1:A6 cells and you want to get a drop down list in B1:B4 cells. Here are the steps for this: Choose the cell in which you want to create a Drop Down list. If you want to get a list of falls down in multiple cells, select all the cells. Go to the data - check.com. In the pop-up data verification field, make the following changes: Cell Range: Sheet1! B1:B4 Criteria: List from range (Leaf1! A1:A6) On invalid data: Show Appearance: Check the display button in the cell to show the option of the click on Save list. This will create a list of drop out in the B1:B4 cells and show items in the A1:A6 range. A1:A6. Cell where you have a drop down list, you can choose from a fall down, or you can enter it manually. If you type something that doesn't correspond to these elements, you'll see that the cell is highlighted (with a red triangle at the top right bottom of the cell), as shown below: there is also the option to disable the input of data in the cells if the input does not correspond to these elements. To do this, in the data verification settings (as shown above) in the On invalid Select Select Input option. Now, if you type anything that doesn't fit the specified items, you'll see the Invalid Note as shown below: Manually Entering The Drop Down List Elements If you want to create a list of falls down with static options (e.g. Yes/No, High/Medium/Low, Agree/Disagree), then you can also manually enter these options in data verification. Here are the steps: Choose the cell in which you want to create a Drop Down list. If you want to get a list of falls down in multiple cells, select all the cells. Go to the data - check.com. In the pop-up data verification field, make the following changes: Cell Range: Sheet1! Criteria B1:B4: List of items (in the field on the right, manually enter items separated by a comma) On invalid data: Show a warning appearance: Check the display button in the cell to show the option of the list Click on Save. This will create a fall list in selected cells that will show these items. How to copy Drop Down lists in Google sheets If you have a drop down list in one (or more cells) and you want to quickly copy the drop down, you can do so with this simple copy paste trick. Here are the steps: Copy a cell that has a drop down list that you want to copy. Choose the cell/cells in which you want to copy the drop-off list. Tap the right button and go to Paste Special - the paste data check only. This will copy the fall list down to the selected cells. Note: You can do the same with a simple copy and paste as well, but this will copy the formatting as well. How to remove drop Down lists from cells to remove the drop list from the cells in Google sheets: Select the cells from which you want to remove the drop list. Go to the data - check.com. Click on the removal check button. Related: Create a fall list down in Excel. You can also like the following Google Sheets Tutorials: If you're working with others on a shared Google Sheets file, sometimes people can enter unexpected data or something that breaks the formula. One way to make sure everyone enters the data you want is to provide them for them in the drop check list. How to create a list to drop out of the A list is a great way to ensure that the data that people enter into your form, application, or spreadsheet is exactly what you expect. He provides a much faster way for people to enter this data, as they choose from the pre-configured list you provide. The first thing you need to do is open the Google Sheets file and select the cell (s) for which you are you use a dropout list. RELATED: 5 Google Sheets Features You Should Know Next, Open Menu Data and Select Data Check Team. From the fall criteria, choose either a list from the range or a list of items. List from the range: List of values that have been selected from other cells in the same or other sheet. For example, if you want to use B1-B9 values on Sheet 2, you're with Sheet2! B1:B9 to make the data contained in them appear on the list to drop out or select any of the cells from your sheet directly. Item List: List of predetermined data items. It can be both text and numbers, and you will gain each value by dividing them into commas (and no spaces). This option prevents data from sticking directly from other cells. Here we use the Item List option and provide multiple numerical choices. Once you've entered the data you want to appear on the list drop out, make sure you have the option to show a drop list in the cell, otherwise the values won't show up in the selected cells. You can also choose what happens when someone tries to enter a value that is not on the list. The Show Warning option allows them to enter invalid data, but notes them in the sheet (we'll see how in a little bit). The Reject Entry option prevents them from entering anything that is not on your list. Finally, you can include the Show Check help text option to give people some idea of what they can choose in the cells. After selecting the option, enter all the instructions

you want. Go ahead and click Save when you're done. How to use the new Drop-Down list When you're done, anyone who uses a sheet can click on the drop arrow in those cells and choose the value from the list. If you choose to show the verification help text, this text pops up whenever someone selects one of the verified cells. If someone enters a value that doesn't match something on the list, and you have a Show Warning option enabled, invalid data is flagged in the cell. The hover over it shows why it is tagged. If you choose to reject the entry instead, people will receive a warning like this when they try to enter everything that is not on your list. If you need to remove or change any of the items from the list fall back into Data qqt; Check the data to edit any items from the lists that you have created. Delete the list completely as easily as click the Delete check button at the bottom. Lower.
